1.

Consider the problem of predicting how well a student does in her second year of college/university, given how well she did in her first year.

Specifically, let x be equal to the number of "A" grades (including A-. A and A+ grades) that a student receives in their first year of college (freshmen year). We would like to predict the value of y, which we define as the number of "A" grades they get in their second year (sophomore year).

Here each row is one training example. Recall that in linear regression, our hypothesis is  $h_{\theta}(x)=\theta_0+\theta_1x$ , and we use m to denote the number of training examples.

| x | у |
|---|---|
| 3 | 2 |
| 1 | 2 |
| 0 | 1 |
| 4 | 3 |

For the training set given above (note that this training set may also be referenced in other questions in this quiz), what is the value of m? In the box below, please enter your answer (which should be a number between 0 and 10).

## Linear Regression with One Variable

4/5 points (80%)

Quiz, 5 questions Many substances that can burn (such as gasoline and alcohol) have a chemical structure based on carbon atoms; for this reason they are called hydrocarbons. A chemist wants to understand how the number of carbon atoms in a molecule affects how much energy is released when that molecule combusts (meaning that it is burned). The chemist obtains the dataset below. In the column on the right, "kJ/mol" is the unit measuring the amount of energy released.

| Name of molecule | Number of hydrocarbons in molecule (x) | Heat release when burned<br>(kJ/mol) (y) |
|------------------|--|--|
| methane          | 1                                      | -890                                     |
| ethene           | 2                                      | -1411                                    |
| ethane           | 2                                      | -1560                                    |
| propane          | 3                                      | -2220                                    |
| cyclopropane     | 3                                      | -2091                                    |
| butane           | 4                                      | -2878                                    |
| pentane          | 5                                      | -3537                                    |
| benzene          | 6                                      | -3268                                    |
| cycloexane       | 6                                      | -3920                                    |
| hexane           | 6                                      | -4163                                    |
| octane           | 8                                      | -5471                                    |
| napthalene       | 10                                     | -5157                                    |

You would like to use linear regression ( $h_{ heta}(x) = heta_0 + heta_1 x$  ) to estimate the amount of energy released (y) as a function of the number of carbon atoms (x). Which of the following do you think will be the values you obtain for  $\theta_0$  and  $\theta_1$ ? You should be able to select the right answer without actually implementing linear regression.

1/1 points

Suppose we set  $heta_0=-1, heta_1=2$  in the linear regression hypothesis from Q1. What is  $h_{\theta}(6)$ ?

## Linear Regression with One Variable

4/5 points (80%)

Quiz, 5 questions

Let f be some function so that

 $f( heta_0, heta_1)$  outputs a number. For this problem,

f is some arbitrary/unknown smooth function (not necessarily the

cost function of linear regression, so f may have local optima).

Suppose we use gradient descent to try to minimize  $f( heta_0, heta_1)$ 

as a function of  $\theta_0$  and  $\theta_1$ . Which of the

following statements are true? (Check all that apply.)

1/1 points

5.

Suppose that for some linear regression problem (say, predicting housing prices as in the lecture), we have some training set, and for our training set we managed to find some  $\theta_0$ ,  $\theta_1$  such that  $J(\theta_0,\theta_1)=0$ .

Which of the statements below must then be true? (Check all that apply.)
